

Management Reporting

Management reporting is complex and getting the right information at the right time is crucial for good decision making. SMS builds database applications that allow management to harvest the wealth of information that is available in organisations but sometimes is overlooked or deemed difficult to capture. Using iForms or direct online input data gathering can be strategically designed to tap into the multiple information sources available in an organisation. SMS management reporting applications are used to generate routine fixed format reports and also to perform advanced queries to provide trend analysis and drill down features. Reports can be output in printable formats or exportable files.

In many companies management reporting consists of ad hoc arrangements based on shared network drives and files setup and maintained by under resourced IT departments. In many instances these arrangements are good, but could you do better?

IMAGINE you are responsible for managing an organisation with many sites/depots and management information could be reported and updated at all locations INSTANTLY.

IMAGINE you are responsible for managing an organisation with offices located around the world and management information could be reported and updated at all locations INSTANTLY.

FEATURES AND BENEFITS

1. Cost Factors

The reporting solutions are web applications requiring little or no roll out costs. Only requirement is a broadband Internet connection. The system resides in one place which reduces the cost of administration and maintenance. Streamlines the management reporting process and thus reduces administrative cost.

2. Management Control

Standard reporting procedures can be implemented across group companies or multiple locations/depots. Periodic reporting is completed fast and available all departments/locations instantly. Executives on the move always have access to the latest information.

3. User interface

Familiar Windows style working environment. Database browser enables users to call up standard reports for specified date range and other specified variable criteria. Advanced query tool for drill down and in depth performance reviews. Information can be presented on screen or printable reports or as exportable files suitable for inclusion in spreadsheets or Power Point presentations

4. Security

High-grade security architecture ensures controlled access to information by user defined roles.
